

We've taken a great thing and made it better...

Introducing the *newly upgraded* Million Cycle Switch!

New protective rubber boot at the top of the rod seals out any debris from entering the switch housing and affecting the relay components. The flexible rubber is designed to protect the switch components cycle after cycle

New brass fittings at the bottom and top of the rod makes the activation of the switch even more consistent and reliable.

The rod is now made of fiberglass, making it super strong and lightweight. The fiberglass construction ensures a straight path for the float and eliminates the resistance that can occur with plastic rods. By making it about an inch longer, pump runtime increases while reducing short cycling.
